INTRODUCTION.

We take pleasure in presenting to our friends and the trade our new Illustrated Catalogue and Price-List. In issuing this edition, every care has been taken to make it thorough and complete in all its parts, and a standard reference book for the trade.

It will be our constant aim to retain the confidence and patronage of our customers, by supplying them with the best of material at the lowest market rates. Our stock is very complete, and orders will be carefully and promptly filled.

Since our last General Catalogue was issued, we have largely increased our variety, and the present edition will be found to contain a very complete representation of the leading goods in the line of Copper, Iron and Earthenware, Water Closets, Traps, etc., etc.

In the lines we are now handling, we have increased our stock to cover the wants of our customers, as nearly as possible, our aim being to supply all demands in short order.

Discount sheets will be issued with this Catalogue, and will be changed as occasion requires.

Gratefully acknowledging past favors, and soliciting future patronage, we are

Respectfully yours,

ENGLISH BROTHERS.

EXTRA WIRE GAUGES.

For extra Wire Gauge Boiler Tubes away from standard, not exceeding four wire gauges, add one and one-half cents for each inch in diameter to the list price per foot for each additional number. To calculate price take discounts from list prices of regular tubes and add net charge for extra Wire Gauge.

FOR ONE NUMBER.	FOR TWO NUMBERS.	FOR THREE NUMBERS.	FOR FOUR NUMBERS.
2 inch, 2 cents.	2 inch, 4 cents.	2 inch, 6 cents.	2 inch, 8 cents.
2¼ " 2¼ "	2¼ " 4½ "	2¼ " 4½ "	2¼ " 9 "
2½ " 2½ "	2½ " 5 "	2½ " 7½ "	2½ " 10 "

And so on for every size.

Intermediate sizes not on list, same price as size above.
Swagging or swelling 2 inch or 2¼ inch tubes, five cents per end extra.
No reduction made or allowed for tubes lighter than the standard.

A charge of eighty cents per hour will be made for cutting screws on boiler tubes.
Lock nuts for stay bolt tubes must be charged for extra, and never included in price of tubes.

SAFE ENDS.

NET PRICES FOR SAFE ENDS TO 6 INCHES LONG, INCLUSIVE.

Over 6 inches long, the extra length will be charged for in proportion.

Size	1	1¼	1½	1¾	2	2¼	2½	2¾	3	3¼	3½	3¾	4	4½	5	6
Each End.....	.13	.13	.13	.13	.13	.14	.16	.18	.20	.22	.25	.27	.29	.32	.37	.45

NET PRICES FOR SAFE ENDS PUT ON NEW BOILER TUBES.

Each End.....	.20	.20	.20	.20	.20	.23	.23	.27	.31	.34	.38	.41	.44	.49	.56	.69

NET PRICES FOR REPAIRING AND SAFE ENDING OLD BOILER TUBES.

Size	1	1¼	1½	1¾	2	2¼	2½	2¾	3	3¼	3½	3¾	4	4½	5	6
Ea. Boiler Tube, both ends	.60	.60	.60	.60	.60	.68	.80	.94	1.00	1.17	1.40	1.61	1.78	2.08	2.70	3.12

No additional charge will be made for safe ends of extra wire gauge. All boiler tubes under 12 inches long to be called safe ends. The charges for extra gauges, safe ends, etc., are not subject to the current discount from price list of tubes, but are in all cases net.

EXTRA LENGTHS OF BOILER TUBES.

The rule governing prices of lengths of tubes over 18 feet was abolished July 15, and instead thereof, the following adopted: The list prices cover all tubes up to and including 8 inch diameter and 20 feet long. For over that length, an extra charge of ten per cent. will be made on net of invoices. The list prices of 9 inch and upwards are for any length.

R. H. Couplings.....	$1\frac{1}{4}$ and larger

Galvanized Fittings and Straps. 5 Cents per Pound Extra.

REVISED LIST

OF

Malleable and Cast Iron Fittings

FOR

Gas, Steam and Water Pipe.

Our new patterns for Cast Iron Fittings, for beauty, finish and strength, are unequaled by any others in the market.

In ordering, please state whether "Cast Iron" or "Malleable."

NOTE.—All classes and sizes are made in Malleable, from $\frac{1}{4}$ in. to 2 in. inclusive, also Ells, Tees, Crosses and Reducers, $2\frac{1}{2}$ in. to 4 in. as numbered, viz.: 38, 42, 46, 50, 254, 255, 256, 265, 266, 267, 268, 269, 282, 295, 391, 394, 397, 494, 495, 496, 497, 539, 542, 543, 547, 548 and 550. All other sizes above 2 in. are made of CAST IRON ONLY.

Also such sizes as are indicated by the letter "C" are made of Cast Iron.

We keep all sizes of "Gas or Plain Fittings" up to 2 in. except those marked "*", which indicates "Beaded."

We keep in stock "Malleable" Galvanized Fittings, such numbers as marked "G," also furnish TO ORDER Galvanized Cast Iron Fittings.

FITTINGS MADE TO ORDER AT AN EXTRA CHARGE.

Steam Engineers have found that the Standard Fittings have been cut so short, that they are utterly unsuitable for Water fittings, and also for Steam, where the full pressure is required for Engine or Steam Pumps, &c.

The Radius (as will be seen) is very much increased over that of the ordinary fittings, thus reducing the friction to a minimum.

For Hydraulic and Steam Connections are invaluable.

CAST IRON FITTINGS. BRANCH TEES.

No. 1.—FOR BOX COILS.

LARGE PATTERN.

No. 3.—SMALL PATTERN.

No. 2.—FOR CIRCULATION.

LARGE PATTERN.

No. 4.—SMALL PATTERN.

Steam Fitters will find that No. 1 and 3 patterns are the most desirable to use, for the supply end of a Circulation as well as Box Coils, in consequence of the feed coming in on the side, thus scattering the steam and forcing the air uniformly out, more so than can be done by using a Tee that is fed on the end.

Number of Branches.	Nos. 1 and 2. Large Pattern. For Box and Circulation Coils. For 3-4 Inch Pipe. 2 inches Centre to Centre.			Nos. 1 and 2. Large Pattern. For Box and Circulation Coils. For 1 Inch Pipe. 2½ inches Centre to Centre.				Nos. 3 and 4. Small Pattern. For Box & Circulation Coils. For 1 Inch Pipe. 2½ inches Centre to Centre.

16				7 75	8 00	8 15	8 40		

Branch Tees not specified above will be made to order at an advance of 25 per cent.

NOTE.—Inlets and outlets same size as branches unless specially ordered.

Small Pattern for *Circulation* have inlet at one end and outlet on back.

Large Pattern for *Circulation* have inlet at one end and outlet on back.

Small Pattern for *Box Coils* are tapped left hand and have a back outlet only.

Large Pattern for *Box Coils* are tapped left hand and have a back outlet only.

When Branch Tees are ordered left hand we take it for granted they are for Box Coils, and will so fill the order. If left hand are wanted for Circulation, *the order must distinctly state that fact.*

In all cases please state for what purpose the Branch Tees are required, Box Coils or Circulation.

EXTRA HEAVY GLOBE AND ANGLE VALVES—BRASS.

With Jenkins' Patent Disc.

The great annoyance caused by leaky Valves has induced many inventors to experiment with many kinds of changeable and yielding compositions, which, when used in the form of a washer in connection with valve seats, would obviate this annoyance, but the only one that has met with success is the "Jenkins."

Various forms of Valves using Jenkins' Patent Composition Disc have been in extensive use in the East for years, and give very good satisfaction.

The patent consists of combining with the use of the above named composition a raised seat, *A*. The composition, *C*, being confined within walls, *D*, and the raised seat fitting the same, we claim that the composition is thus protected from any crushing tendency, and will last much longer than any of the Valves of this class now before the public.

Size, inches.	$\frac{1}{2}$	$\frac{3}{4}$	1	$1\frac{1}{4}$	$1\frac{1}{2}$	2
Price, each	1.90	2.70	3.50	4.90	6.50	10.25

ROSEWOOD WHEEL.

Size, inches.	$\frac{1}{2}$	$\frac{3}{4}$	1	$1\frac{1}{4}$	$1\frac{1}{2}$	2
Price, Nickel Plated	2.25	3.20	4.00	5.60	7.40	11.50
Price, not Plated	2.10	2.95	3.75	5.30	7.00	11.00

THE "CRANE" PATENT CHECK VALVE—BRASS.

Horizontal. Extra Heavy.

The "Crane" Patent Valve has a much larger seat, a larger area, and is so constructed that the back pressure comes on the top of Valve, thus preventing the side wear of the seat and insuring prompt closing; overcoming all the difficulties in the ordinary Valve.

Size, inches.	$\frac{3}{4}$	1	$1\frac{1}{4}$	$1\frac{1}{2}$	2
Price, each	2.70	3.50	4.90	6.50	10.25

CODY'S PATENT

Air-Tight Shaft and Engine Oilers.

Shaft Oiler.

Engine Oiler.

ADVANTAGES OF USING CODY'S SHAFT OILERS.

They are all made in a first-class manner, of the best materials, and are warranted in every respect. They are as reliable in winter as in summer. Being perfectly air-tight, the oil will never gum in them, and is always free from dust and grit. They will feed only when the machinery is in motion. In case of breakage, a glass can easily be replaced at a small cost.

DIRECTIONS FOR USING CODY'S SHAFT OILERS.

Fill the Oiler full of oil; screw on the socket air-tight, and then screw the stem tightly into the oil-hole in bearing. When the cups need re-filling, unscrew the stem out of the hole; take the oiler apart, and proceed as before, See that the hole through stem is always clear of any obstruction before putting the oiler in its place.

 See that the Glass Globe is always tight in its socket.

TO REGULATE SHAFT AND ENGINE OILERS.

By turning the regulating screw a *quarter-turn backward* the supply of oil is entirely cut off.

The perspective view shows the screw in the proper position to give a moderate feed. The feed on all Cody Oilers is regulated ready for use.

PRICE OF SHAFT CUPS

No.	CAPACITY.	DIAMETER.	HEIGHT.	PRICE PER DOZEN.
1	1 oz.	1 $\frac{3}{4}$ in.	2 $\frac{5}{8}$ in.	\$6 00

Price, $\frac{1}{2}$ Pint.....\$29.00 | Price, Pint.....\$36.00 | Price, Quart.....\$42.00

Directions for Connecting and Operating Lubricator.

A—Shut-off valve; B—Water valve; C—Regulating valve; D—Overflow valve; E—Filling plug;
 F and G—Drain plugs; H—Union coupling.

First.—Attach union coupling H to steam pipe between throttle and boiler if convenient.

Second.—If not, then either on steam chest or pipe below throttle.

Third.—Connect Lubricator to union. When so connected see that valves B and C are closed, then open valve A, when condensation will take place and fill feed glass.

Fourth.—Remove filling plug E and fill reservoir with oil; replace filling plug, seeing that drain plugs F and G are tight.

Fifth.—Then open water valve B, waiting five minutes, then open oil regulating valve C and regulate the feed as may be required.

Sixth.—If slow feed is required open valve D to allow surplus condensation to pass back into steam pipe.

Seventh.—Cauton must be used when Lubricator is connected on steam chest, or pipe below throttle, to close regulating valve C before shutting steam off to prevent feed glass from becoming foul.

Eighth.—To clean feed glass, close water valve B, open drain plug G, and blow steam direct through glass. Then close drain plug G and oil valve C, allowing condensation to take place as before. Then open water valve B. then oil valve C and regulate as before.

Ninth.—The following is about the feed required for the size of engines given:

10 to 40 Horse Power.....	1 to 6 drops per minute

" 3 $\frac{1}{2}$, 6 " ".....	16 00	No Crosby Gauge less than 4 $\frac{1}{2}$ in. dial.	

Gauges with Deep Composition Cases, or Octagon Faced Rings, extra.

The Crosby Improved Gauge, at above prices, marked to any pressure not to exceed 500 pounds per square inch.

The maximum pressure required should be stated in ordering above Gauges.

BOURDON PRESSURE OR VACUUM GAUGE.

Gauge Syphon.
Each, 25c.

We also carry a high pressure Bourdon Gauge, for a certain trade, as follows :

No. 10, 5 inch dial, Iron Case and O. G. Spun Ring.....	\$6 00
---------------------------------------------------------	--------

Gauges with Deep Composition Cases, or Octagon Faced Rings, extra.

In this Gauge the dial should be marked to nearly twice the pressure required to be carried, which should always be stated when ordering.

IMPORTANT.—All Gauges for steam should be used in connection with a Syphon, and none are warranted without.

All Gauges are graduated and tested by an open mercury column, and warranted correct.

GAUGE COMBINATIONS.

A. One Water Gauge, No. 1, rough body, with two guards; one Bourdon Steam Gauge, $5\frac{1}{2}$ inch dial, iron case; three Compression Gauge Cocks, $\frac{3}{8}$ inch wood handle; one Pet Cock and one Syphon, all fitted to a 14 inch iron column, complete.

Price, complete..... \$18.00

B. One Water Gauge, No. 2, finished body, with two guards; one Crosby Improved Steam Gauge, $5\frac{1}{2}$ inch dial, iron case; three Compression Gauge Cocks, $\frac{3}{8}$ inch wood handle; one Pet Cock and one Syphon, all fitted to 14 inch iron column, complete.

Price, complete..... \$25.00

C. One Water Gauge, No. 3, finished square body; one Bourdon Steam Gauge, $5\frac{1}{2}$ inch dial, brass case; three Compression Gauge Cocks, $\frac{1}{2}$ inch wood handle, with stuffing box; one Pet Cock and one Syphon, all fitted to a 16 inch iron column, complete.

Price, complete..... \$35.00

D. One Water Gauge, No. 3, finished body, with four guards; one Crosby Improved Steam Gauge, 6 inch dial, brass case, plated rim; three Compression Gauge Cocks, $\frac{1}{2}$ inch, with wood handle and stuffing box; one Pet Cock and one Syphon, all fitted to a 16 inch iron column, complete.

Price, complete..... \$42.00

ASHCROFT'S PATENT
NICKEL SEATED "POP" SAFETY VALVES FOR STEAM BOILERS.

Patented in the United States, Canadas and Europe

No. 1.

This cut shows Valve and Spring without Cover.

No. 2.

Base, Male or Female

Made with Top or Side Outlet for Steam.

This Safety Valve is Non Corrosive, Prompt and Efficient.

For Stationary and Marine Boilers, approved by the United States Board of Supervising Inspectors.

The Nickel-Seated Safety Valve is perfectly automatic in its action, capable of discharging all the steam generated in a steam boiler, in excess of a given limit; and its bearing surfaces, which are made of solid nickel composition (not nickel plated), will not corrode, giving absolute immunity against explosion. Such a Valve will secure the boiler from injury and protect the lives of the people employed about it; and, *if desired, it may be locked up.*

In ordering, state size and kind of Boilers, and the highest working pressure carried. Also, whether you wish to attach Valves with Flange or Nipple.

Special attention given to the construction of Valves where INSTANT relief from excessive pressure is required.

PRICES NO. 1.

NOTE.—In ordering, state pressure at which you wish to blow off.

THE HANCOCK INSPIRATOR.

When ordering an Inspirator, please answer the following Questions;

1. What is the horse-power of boiler or boilers; or what is the quantity of water required per hour?
2. What is the range of steam pressure?
3. What is the temperature of supply?
4. What is the extreme lift or head, vertically or horizontally, from supply to Inspirator?
5. Is water used for other purposes than feeding boilers?
6. What is the number of boilers?
7. What type of boiler is used?
8. What are the dimensions of boilers?

THE DUPLEX INJECTOR.

For Stationary, Marine and other Boilers. Unequaled for Simplicity, and always Reliable.

The best Boiler Feeder known; perfectly simple; always reliable; requires no adjustment; will take water under pressure; will lift water twenty-five feet; no overflow; no waste of water; works well with high steam; works well with low steam; less liable to get out of order than a pump; will feed water through a heater; for economy no superior.

In ordering the Duplex Injector, please state,

First.—The horse power of boiler or boilers, or give diameter and length of boiler or boilers and style, viz.: Tubular, Two Flue, Portable or Marine.

Second.—Give the steam pressure carried.

Third.—Whether water is taken under pressure or not.

Fourth.—If water is to be lifted, give the lift or distance from Injector to water supply, both vertically and horizontally.

VERTICAL "RIVAL" STEAM PUMPS.

FOR FEEDING BOILERS, FIRE PURPOSES, ETC.

The "Rival" is a complete Steam Engine and Pump combined. It has a Slide Valve, operated by an eccentric on the Shaft, and also a Balance-Wheel to steady the motion. The Pump is the simple plunger pattern, and packed in the usual manner at the top end. The Valves are of the heavy cup pattern, without stems, giving a perfectly free opening, and not liable to be displaced by high speed. They are adapted to pump both hot and cold water.

These pumps will take water from the Stillwell, Armstrong or other Heaters. The opening in the Heater should be as large as that in the Pump, and the Heater located above the Pump. To pipe these Pumps to operate to best advantage, the Inlet Pipe should be as short as possible and full size, particularly when hot water is to be pumped. If the Inlet Pipe is long, a Vacuum Chamber should be attached near the Pump, which can be made by attaching an upright pipe in a **T**, and closed at the top end.

By the addition of an Air Chamber to the Force Pipe, made in the above manner, the Pump can be used for fire purposes. These Pumps are not intended to take water by suction.

STEAM JET PUMP.

Which is Designed for Supplying Water Tanks at Mills or Factories.

FOR PUMPING WATER OR OTHER LIQUIDS, AT MINES, DISTILLERIES, BREWERIES, ETC., AND TO TAKE THE PLACE OF MORE EXPENSIVE PUMPS WHOSE COMPLICATED PARTS RENDER THEM THE MORE LIABLE TO BREAKAGE.

Please notice the following points of superiority over the ordinary Cold Water Pump. where, as in most locations, it is necessary to raise water only to moderate heights or to fill Tanks for the feeding of Boilers :

Fig. 80.

Drawing steam direct from the boiler; they may be operated regardless of all other machinery and can be placed in a cistern, well, or near any water supply at any distance, either long or short from the boiler. The standard size will make 14 feet suction and will raise water from 15 to 60 feet in height. The pressure of steam required is about one pound per square inch for each foot the water is to be raised. Our Pumps are made, in all their parts, of standard sizes and are uniform in their operation. As they have no moving parts they require no packing and CAN NOT GET OUT OF ORDER.

Directions for Purchasing and Putting up Steam Jet Pump.

- 1st. The size of the Pump is determined by the internal diameter of the Suction Pipe.
- 2nd. In no case should a smaller Pipe be used than indicated in the table below, and where the Pump is placed a long distance from the Boiler, the Steam Pipe should be one or two sizes larger and should be protected by some kind of packing.
- 3rd. In ordering Pumps give distance of water from Tank; from the Boiler to where you desire to place the pump; height to which water is to be raised and pressure of steam used.
- 4th. Place the Pump at a point as near the water as possible, and not over 14 feet perpendicularly from the water to be raised. Put a Stop Cock in the Steam Pipe at a convenient point for starting and stopping the Pump.
- 5th. Connect the Steam, Discharge and Suction Pipe, as shown in the above cut, and place the Discharge Pipe so that the water will all run out, when the steam is shut off. It will be necessary to fit a Strainer on the end of Suction Pipe, using care that the supply of water is not reduced too much thereby.

DIRECTIONS FOR OPERATING.

- 1st. Turn on the Steam slowly until the Suction is formed, which will be indicated by a peculiar noise in the Pump; then turn on Steam enough to drive the water to point of discharge.
- 2nd. In case the Pump fails to start, one of the following three causes must be remedied: 1st. Leaks in the Suction Pipe. 2nd. Obstructions in the Suction Pipe or in the Pump. 3rd. Too high suction. Not over 25 lbs. of steam need be used to form the suction, and higher steam must be carried according to the height of the discharge at about the rate of one pound per foot.

These Pumps will operate with best results where there is a plentiful supply of water. It is sometimes noticed that after running for a time they will suddenly "let go," and have to be started again. This may be due to a scarcity of water, a leak in the Suction Pipe, which, becoming exposed by the lowering of the water, lets the air into the Pump, or a PEBBLE IN THE PUMP; this last is often quite annoying, as for instance: a pebble which is too large to pass through the water nozzle in the Pump, will act as a "bob," and will, by advancing and receding, partially shut off the discharge and finally becoming fast, will stop the Pump. When the steam is shut off, the water in the discharge pipe running back, will dislodge the pebble and force it back into the Suction Pipe, where it will remain and cause the same annoyance indefinitely, until it is removed or passes through. A strainer placed on Suction Pipe will obviate that difficulty and save much annoyance.

These Pumps are not for feeding Boilers (which only can be done by a Force Pump) They are made entirely of Brass, which prevents them from rusting or corroding when other liquids than water are used. Every Pump is fully warranted. In case any are imperfect we will bear all expense of express, in making the exchange for another one. or will refund the money if preferred.

JUDSON PATENT IMPROVED GOVERNORS.

When Governors are ordered, be particular and say, Governor with Stop Valve, or without Stop Valve; and either Plain or Bright Finish, as you may require, and with or without Speed Changer, Stop Motion or Sawyer's Lever. Exact speed of each Governor is marked on the top head. See also column of Speeds in Price List.

Cap. of Governor, or Diam. of Steam Pipe, inches.	PRICE OF J. & G. GOVERNORS.					Size of Governor to Diam. of Engine Cylinder at ordinary speed of Piston (300 feet per minute). For greater speed, use larger Govern- ors.	Diam. of Base Flange, inches.	Diam. of Side Flange, inches.	Distance from Base Flange to Center Steam Pipe, inches.	Distance from Center Govern- or to end Pulley Shaft, ins.	Extreme Height, inches.	Distance from Base Flange to Center Pulley Shaft, ins.	Distance fr. Center Governor Valve to Stop Valve, ins. THE SMITH-VAILE STEAM PUMPS

Are Recommended to the Users of Steam Pumps as the Simplest and Most Durable of any in the Market, for the following Reasons:

First.—A plain Slide Valve.

Second.—Simplest in construction.

Third.—Made of the best material.

Fourth.—A positive connection from Piston Rod to main Valve.

Fifth.—Gradual closing of Steam Valve as it approaches the end of its stroke.

Sixth.—Using no Springs, Tappets or revolving Valves in Steam Chest.

Seventh.—An improved removable Water Cylinder.

Eighth.—Adapted for either hot or cold water.

Ninth.—No dead centers.

Tenth.—Can be run at any speed.

Eleventh.—Using the Improved Removable Water Cylinder.

It is for the interest of the purchaser, when ordering a Pump, to state fully the condition under which they desire the Pump to work:

First.—For what purpose is the Pump to be used?

Second.—What is the average steam pressure?

Third.—What is the liquid to be pumped, and is it hot or cold?

Fourth.—The height to be lifted by suction?

Fifth.—The height of discharge above the Pump?

Sixth.—The greatest and average amount of liquid per hour?

In all Pumps of 10-inch stroke we use only two sizes of Water Box, the smaller size taking from 4 to 6½ inch diameter removable Water Cylinder; the larger size taking from 6 to 7½ inches diameter.

These removable Cylinders are turned to gauge, so that they can be removed for repair, when needed, and another inserted without disturbing the pipe connections, and of sufficient thickness to admit of re-boring when necessary.

THE SMITH-VAILE STEAM PUMP is direct-acting, having a *positive motion* imparted to the main Slide Valve from a Cross-Head on the Piston Rod, through a Concave which is directly connected to the Slide Valve (as shown in cut).

By the movement of the Cross-Head under the Concave, the main Valve is closed gradually, commencing at two-thirds stroke, thus preventing much of the concussion of a reverse stroke.

Attached to the main Valve, and carried with it, is a supplemental Piston, which, on the arrival of the main Valve at the center, takes steam at one end and carries the main Valve to the end of its stroke, or opens the port for a reverse stroke of the Pump—this being the only duty of the supplemental Piston, as the closing of the port is done by the Cross-Head.

THE DAYTON CAM PUMP

Is especially adapted to boiler feeding at slow speed; also, in returning the condensed water of steam heating-coils direct to the boiler without the use of traps. This simple form of heating buildings does away with all complications, freezing of pipes, troublesome traps, etc., etc.

We are prepared to show plans of how buildings with dry houses connected, using over one hundred thousand feet of heating pipes, have been heated for the past three years (without any traps), and the condensation returned to the boiler at a heat due to 100 pounds boiler pressure, working automatically, requiring no further care than oiling the Pump occasionally.

DAYTON CAM PUMP.

Every Pump and Boiler thoroughly tested before leaving our Works.

Eureka Low Pressure Steam Heating Apparatus.

Fig. 81.

SECTIONAL VIEW OF LOW PRESSURE STEAM GENERATOR, FRONT TO REAR.

EXPLANATION.

(A) Fire-box. (B) Fire-grate; a shake and dump grate, perfectly cleaned of waste quickly, without losing the fire. (C) Grate bar supporting fire grate. (D) Space between fire and ash grates. (E) Ash pit beneath ash grate. (F) Ash grate in two parts. (G) Steam dome connected to top of boiler proper, with three nipples *k k*, which extend to height of concave surface, holding water to that height, thus preventing the possibility of superheating. By this arrangement water is carried much higher in the boiler proper than is practical with ordinary vertical boilers, and greater length of life is given it. (H) (H) (H) Steam feed pipes. (L) Cleaner box, through which tubes are cleaned with steam, and more quickly than most other boilers. (M) Feed mouth for fuel. (N) Smoke flue with direct and indirect connections. (O) Damper set in direct flue. (S) Diagram of open flange on outside, to which return drip pipes are connected. (T) Apex of an inverted V, closing at a point just below where the diameter of smoke flue would come below bottom edge of dome. The extremes of the Δ extend down and around the sides of boiler, terminating just above the flanges S. The work entire is set on a cast iron base plate (seen at bottom). In setting the brick work a space three inches in the clear is left around the boiler proper and circular part of base, except the Δ , which is made by crowding bricks in on end against the boiler.

The Δ constructed as described, in combination with damper O, when closed compels the products of combustion, when passed through the tubes, to turn over and down that part the shell in front of the Δ , when, on reaching its extremes at S, they pass to the rear and out through the indirect base flue of smoke pipe N. This is the usual operation, and by it the fire surfaces are largely increased, and with the more thorough application of heat there is much less fuel required to make the same steam than with most boilers. The damper in direct flue may be opened for any needed convenience.

EUREKA LOW PRESSURE STEAM HEATING APPARATUS.

Fig. 82.

SET IN BRICK, WITH TRIMMINGS AND FIXTURES COMPLETE.

EXPLANATION.

At the top will be seen the main steam feed pipe with valve set to same; also safety valve. A connection for the steam cleaner with valve set at front edge, and, for convenient illustration, we have shown the hose and cleaner attachment complete.

By this attachment to clean the boiler flues, the valve in feed pipe would be closed, steam run up to ten or twelve pounds, when, on opening the door above ornamental front and inserting the cleaner, each tube may be blown clean of soot, also any recesses in or around the boiler. Hand holes, for cleaning out soot accumulations at base of boiler work are shown on side and front. At the right upper corner is seen the Combination Box with Trycocks, Water Gauge and Steam Gauge attached.

On the left hand upper corner is seen the Automatic Regulating Apparatus, with its attachments. The chain at right hand of bar connects to the draft door and the one on the opposite end to the door of the cold-air check draft. By increasing the weight seen on the left hand end of bar the fire and steam is increased, and by decreasing the weight the intensity of the fire and steam is reduced, and the weights may be so adjusted as to hold the steam continuously at one's will. At front left hand corner of brick work is seen the water connection with the valve shut off. Also below the inlet to boiler, is seen the waste or blow-off attachment, for cleaning the boiler of water or sediment, which waste should connect to sewer.

At the left hand lower center is seen the connection for return to boiler of waters of condensation, with a check valve on the angle. The ornamental front shows the doors opening into fire pot, the draft door opening to between the fire and ash grates, and ash door opening to underneath ash grate for the removal of ashes. That part of the lower center front containing the draft and ash doors is removable to admit of replacing the grates.

THE BEST IN THE WORLD

THE ALEXANDER SANITARY CLOSET.

Fig. 337.

A FEW FEATURES OF ITS EXCELLENCE.

1. In the Iron Body Closet, the porcelain bowl, being cemented in an iron casing, makes it secure from breakage, and no possibility of leakage.
2. There being a direct outlet from bowl, the contents will be discharged quicker, and the bowl left cleaner than in any other closet.
3. There is no possibility of float being fouled, the bottom of bowl and lower valve being thoroughly washed each time by the flush from tank.
4. There being a flushing rim, the bowl will fill very quickly.
5. The water in the bowl only being used each time, prevents the noise heard through the house, as in other closets where their whole contents are discharged at once.
6. There is less waste of water with better effect than in any other closet.
7. The bottom valve is very simple and strongly constructed, and it may be easily rewashed by unscrewing porcelain washer. There is no disconnecting of closet.
8. Should the supply of water be shut off, the water in the tank, which rises to same height as in the bowl, would be sufficient to flush the closet several times.
9. The rock shaft has a stuffing nut to the trunk, preventing any escape of sewer gas. There is a flow of water that runs between the trunk and bowl on the rock shaft, preventing any paper from lodging there.
10. The overflow is large and doubly trapped, with outlet for ventilation.
11. The water valve is strong, simple and hardly possible to get out of order, easily rewashed, having sufficient size of ball and leverage to shut off at any pressure and without any noise.
12. By adjusting the ball, the height of water can be as desired.

PATENT SEAMLESS RANGE BOILERS.

Copper and Brass.

Fig. 419.

Fig. 420.

For many years efforts have been made to produce a reliable House Boiler, in which the danger of bursting or collapsing, and destruction by rust as in iron, could be overcome. We have succeeded in producing this desired article, and now offer with perfect confidence, our Patent Seamless Range Boilers.

They are made from both Copper and Brass, and *guaranteèd to stand a vacuum*, and are all *tested at Two Hundred Pounds* internal pressure to the square inch. The Boiler consists of two seamless shells, with rounded ends to insure greater strength, joined at the center by a long lap joint, which is covered with a wide seamless band. By cupping these shells from the sheet, a uniform thickness, spring temper, and increased tensile strength are obtained. A seamless band is attached to the bottom of the Boiler, which adapts it to any stand in the market. They are coated with tin on the inside, are handsome, durable, and well finished in all respects, and especially designed for first-class residences.

Price, 30 gallon, Copper or Brass, each	\$30.00

Pure Block Tin Pipe of all the usual sizes and weights.

PIPE CUTTING, THREADING AND BOLT MACHINE.

PEERLESS NO. 8.

This is a representation of our No. 8 machine. It is fitted with Expanding Dies from 2½ to 8 in., inclusive, and is so arranged that the Dies may be changed without removing the Die Block. The machine can be changed almost instantly, to suit any size of pipe. The Expanding Dies are instantly thrown in or out of place by a lever, thus avoiding the necessity of backing off the thread. It is very compactly built and powerfully geared. Lard Oil only should be used in thread cutting.

We have a No. 8 in constant use, and can cut and thread pipe to 8 inches inclusive. Orders for this class of work solicited.

PRICE LIST.

No. 8 Machine complete.....	\$1,200 00
Dies, per set of 6.....	25 00

We are prepared to furnish the Peerless Pipe machines, larger or smaller than above, at bottom prices.

Gas and Steam Fitters' Tools.

JARECKI'S PATENT SCREW PLATE AND PIPE CUTTER.

EACH PLATE REQUIRES ONLY ONE SET OF DIES.

The above represents the best tool in the market for threading and cutting off pipe. Its operation is very simple. The dies can be removed or replaced by giving the round thumb-screw a half turn to the left, which gives free movement to the Cam Plate and allows of its adjustment so as to bring the characters "O" in line. When so adjusted, the holes or openings in the top of the Cam Plate will be directly over the slots in the dies, and the operator will be enabled to see just how to arrange the dies so that the Cams will readily enter the slots. The dies and the pipe-cutting knife are easily removed and sharpened by grinding, and when worn out can be replaced at a small cost.

Another new and important feature in the Jarecki Plate is this: Suppose it is desired to thread a number of pieces of the same size of pipe. Ordinarily, every time a thread is cut the dies must be carefully reset—unless you turn back on the threads, as when using a solid die, which is a very tedious operation—but with the Jarecki Plate, first set the dies to the size of pipe to be threaded, then move the adjustable stud to the right as far as it will go and tighten the lower thumb-nut. This will throw the stud in such a position as to limit the throw of the Cam Plate to the exact point required to bring the dies in position for cutting the thread. When the thread has been cut the Cam Plate can be moved in such a manner as to free the dies from the pipe. Then, to readjust the dies for further work, it is only necessary to move the Cam Plate as far as the stud will permit, and the tool is again ready for use. This simplicity of adjustment is a very important point of superiority in this plate.

A. W. ABRAMS’ PATENT EXPANSION STEEL WIRE TUBE AND
FLUE CLEANER.

THE ONLY RIGID EXPANSION BRUSH MADE,

It can be used until the wire is worn out. By removing Nut, then removing Cone, take off the Brush, and by winding a piece of paper around Rod, then replacing them, it expands the disk so it will fit the tube right again without

getting new Brushes. You can repeat this for ten or twelve times. Every Brush warranted. If not satisfactory, can be returned.

Price, \$1.00 per inch. All Brushes less than 2 inches, same as 2 inches.

MUELLER'S Machine for Tapping Water and Gas Mains

WHILE UNDER PRESSURE.

Fig. 545.

Any main can be tapped while under pressure, without losing any water or gas, except what is contained in the cylinder of the machine, which will go out only when the tapping is done and machine taken off the main. The machine, weighing only fifty pounds, can be easily transported, and one man of ordinary intelligence can *tap a main in fifteen minutes*. Its simplicity and practicability recommend it at once to every one interested in gas or water works.

Each machine is furnished with one of each, $\frac{1}{2}$, $\frac{5}{8}$ and $\frac{3}{4}$ inch Drills, Taps and Plugs for Corporation Cocks, Chain and Wrench; also four Gaskets, 4, 6, 10 and 12 inch, will be sent, unless otherwise ordered.

In ordering Tapping Machine, please state diameter of pipes used in your city.

Price, each.....\$100.00

MUELLER'S

Improved Automatic Water Pressure Regulator.

Fig 546.

This Regulator can be set at any pressure desired in a building, and it will maintain the same, regardless of the highest pressure in the street main.

We absolutely guarantee this Regulator to maintain a uniform pressure in buildings, regardless of the pressure in the mains, such as is produced where the Holly system, or heavy or unsteady pressure is had from Stand-pipe or Reservoir systems.

Using the Regulator, we guarantee a steady and uniform pressure, without any jar to the pipes or any noise usually called "Water Hammer."

Any pressure may be secured that is desired, not exceeding the pressure in the mains, but may be of any less pressure.

The Regulator is simple of construction, and not liable to get out of order, and by attaching it, lighter pipes may be used and more than the expense of the Regulator saved.

No splashing of water from too heavy a pressure; no bursting of pipes or boilers, caused by excessive pressure or defective plumbing.

A pressure of 20 to 30 pounds, as may be desired, can be maintained in any building, notwithstanding a fire pressure of 120 pounds or more on the mains.

By using this Regulator, an effective pressure for fire purposes is obtained sooner, as the house supply pipes are not filled to a fire pressure.

A Relief Valve is provided for expansion of hot water where a boiler is used, so that at no time there need be more than 20 to 30 pounds, or the amount of pressure desired in the house supply pipes. Every Regulator warranted.

Price, for $\frac{3}{4}$ inch Pipe, each.....\$10.00 | Price, for 1 inch Pipe, each.....\$13.00

BOSTON RUBBER BELTING.

Manufactured by the Boston Belting Co., Boston, Mass.

We have the exclusive agency for this market of THE BOSTON BELTING Co.'s celebrated Rubber Machine Belting, patent stretched, with smooth Metallic Rubber Surface, manufactured under patents Nov. 22, 1859, and Aug. 5, 1873. Our Belting is made of *heavy Cotton Duck*, coated with the best of India Rubber, *patent stretched*, and finished with the *Patent Smooth Surface*; is unaffected by *heat, cold or moisture*, and is preferred for Elevators, Gin-bands, Agricultural Machines, Flouring Mills, and for every other purpose for which Belting is used.

9 "	95		

Intermediate widths, above 6 inches, made at proportionate prices. Heavy Five or Six-Ply Belts made to order at an advance of twenty-five and fifty per cent., respectively, on Four-Ply prices.

ENDLESS BELTS.

Made to order, for which three extra feet will be charged for the splices, and ten per cent. additional on the net price of the whole Belt.

We have always in store a large stock of all widths of Two-Ply Belting up to 4 inches; of Three-Ply up to 12 inches; and of Four-Ply up to 18 inches, inclusive. Other wider sizes made to order at one week's notice.

DIRECTIONS FOR LACING AND USING RUBBER BELTING.

For narrow Belts, butt the two ends together, make two rows of holes in each end (thus obtaining double hold), and lace with lacing leather.

For wide belts, in addition, put a thin piece of leather or rubber on the back, to strengthen the joint, equal in length to the width of the Belt, and sew or rivet it to the Belt. The seam of the Belt should always be on the inside.

In putting on the Belting, it should be stretched as tightly as possible, and with wide belts this can be done best by the use of clamps secured firmly to each end of the Belt, and drawn together by bolts running parallel with and outside the edges of the Belt. There is no danger of breaking, as Belting six inches wide and three-ply thick will stand a direct strain of five thousand pounds, and other sizes in proportion.

The Belts will be greatly improved, and their durability increased, by using

POLAR DRESSING.

The use of this Dressing upon Rubber Belts, applied in small quantities, will increase their driving capacity and prevent them from slipping. Very often, castor oil, rosin or lagging wax is used for the purpose, in which case it will be noticed that the Belts become rough, and an accumulation of gum and rubber, which has been torn from the Belts, collect upon the pulleys, and in a short time the Belts become useless, and have to be replaced by new ones. In the Polar Dressing there is nothing used of a gummy or animal nature, and we guarantee it will not dissolve the rubber or leave any accumulation of gum upon the Belts. It produces a smooth, even surface, so when they come in contact with the pulleys they bind more closely, and enables them to transmit a greater amount of power.

Price per lb., 50c. Packed in 5, 10, 25 and 50 lb. cans.

PURE OAK TANNED LEATHER BELTING.

We guarantee our Leather Belting to be made of PURE OAK LEATHER, tanned expressly for the purpose and properly stretched; and we warrant the same to run truly on the pulley and to do good service.

ENGINE, HYDRANT AND CONDUCTING HOSE.

Manufactured by the Boston Belting Co., Boston, Mass.

The Two-Ply Hose, or Conducting Hose, is not calculated to stand much pressure. The Three-Ply Hose (used for Hydrants, etc.) is made to stand a pressure of 100 lbs. to the square inch. The Four-Ply Hose (used for Locomotives and for leading Hose for Fire Engines, and other purposes) is made to stand a pressure of 250 lbs. to the square inch. Hose made especially to order for Steam Fire Engines and Steam Pumps, where unusual strength is required.

JENKINS' PACKING.

IN SHEETS AND GASKETS,

This Packing is Secured by Letters Patent, and All Infringers will be Prosecuted to the Full Extent of the Law.

BEWARE OF IMITATORS AND INFRINGERS. BUY NONE BUT THE GENUINE.

We Claim the Following Advantages Over All Others:

- 1st—It packs a joint better than any packing made.
- 2d—It will stand more heat and pressure, and by being careful in separating the joints, the packing may be used again.
- 3d—It readily accommodates itself to an imperfect surface.
- 4th—It does not rot after being in a joint, but forms what might be termed a metal of itself.
- 5th—In case you want to make the packing thicker and have only thin on hand, by putting two pieces together, placing them in the joint and following it up, they become solid.
- 6th—The scraps may be returned to us, and you will be allowed their value, less the price of re-rolling.

WARRANTED AS REPRESENTED.

Gaskets for Man-Holes, Hand-Holes, Etc., Constantly on Hand.

Directions for Using Jenkins' Patent Sheet Packing.

Place the packing in position and screw the nuts up tight while cold. Let the steam on enough to warm the Packing, which softens it; then follow up the joint gradually until there is no escape of steam.

In cutting bolt holes make them a trifle small.

In packing a steam chest, cut the inside hole one-eighth large all around.

When a joint is to be made that you wish to break without injuring the Packing, the application of Pulverized Soapstone, Plumbago or Chalk will prevent sticking.

After the Packing becomes set, it forms what might be called a metal of itself, and will last for years.

Sheet Packing, 80c. per lb. Gaskets, \$1.00 per lb. Packings for Special Purposes at Short Notice.

ASBESTOS PACKING.

Asbestos, by name, is now very generally known in a superficial way, but few persons, comparatively, have a knowledge of its many wonderful properties and its remarkable adaptability to uses in the arts and sciences.

Asbestos is a mineral, and it belongs to the family of Hornblende, and its special properties may be traced to a peculiar and, as yet, unexplained process of decomposition. The Greek appellation, Asbestos, is given to this mineral on account of its unflammability.

The value of asbestos for packing of various kinds is shown by the following qualities:

1. Its unflammability even at the highest temperature (white heat).
2. Its quality as a non-conductor of heat.
3. Its self-lubricating qualities.
4. Its power of withstanding high pressure and the effect of various acids.

ASBESTOS MILL BOARD.

Pure Asbestos, of the finest quality and strongest fiber, for use in locomotive domes, steam-chest covers, man-holes, hand-holes, cylinder-heads and pipe-joints, flange-joints, acid-joints, etc.

This board has been subjected to the severest tests, and has given entire satisfaction.

It is furnished in sheets, 42x44 inches, from 1-32 to $\frac{1}{4}$ inch thick.

THE CORRUGATED BELT BOLT.

This bolt has been before the public so long, and is so well and favorably known, that little description is necessary. It is made of the finest grade of Norway Wrought Iron, imported expressly for the purpose. The head is provided with a corrugation which serves to hold the belt while the nut is screwed on, and also enables the head to be drawn into the belt, so as to be flush with the surface when it comes in contact with the revolving pulley. The success of this bolt has been positive from the first moment of its introduction, and its sale is largely on the increase.

THE EXCELSIOR WROUGHT-IRON FLAT-HEAD ELEVATOR BOLT.

In addition to the Corrugated Bolt, we handle a forged wrought-iron Elevator Bolt of the style indicated in this cut. This bolt is forged from the best quality of Norway iron, and possesses unusual strength. The head is flat and of large diameter, thus affording a great bearing surface on the belt and preventing the bolt from slipping through under any circumstances. This description of bolt is much used in large mills and other establishments where bolts are subjected to extraordinary strain.

NO. 1 HOUSE PUMPS.

THE "GENERAL FAVORITE."

These Pumps are made *full six inches square*, 3½ inch bore, 9 inch stroke ; capacity, 60 gallons per minute. Use "No 1," 4x4 Tubing, with 1½ inch bore. This is a "general purpose" Pump, is made in all lengths, and particularly suited for Extension Pumps, in which case we use 3 inch bore cylinder, lessening the *quantity* of water thrown at each stroke, but rendering it *easier* to operate.

GENERAL WESTERN AGENCY**FOR****SILVER & DEMING M'F'G. CO.'S****PUMPS AND HYDRAULIC MACHINERY.**

TO THE TRADE.

As the General Western Agents of the Silver & Deming M'f'g. Co. we shall at all times carry a complete line of their Pumps. The marked favor with which these goods have been received since we have represented them enable us to unhesitatingly pronounce them the most desirable line of Pumps known to the trade.

ENGLISH BROTHERS.

REMARKS.

For the benefit of those not familiar with Pumps, we offer in this connection a few general remarks on the subject.

The necessary parts of a Pump are the Cylinder, Plunger, Check-valve, and Suction or Connecting Pipe; and in order that a Pump may do its work properly, all these parts should be in perfect order. The Cylinder should be bored true, and should be air-tight; and the Plunger should fit it accurately; so that it will make a vacuum as nearly perfect as possible. For cold water, the Bottom or Check-valve should be made of leather or rubber, or of a combination of these materials.

The Suction Pipe is the pipe reaching from the Cylinder to the water, and to have the Pump work properly, should be air-tight. The Suction Pipe should be about one-half the diameter of the Cylinder, and the Discharge Pipe may be smaller in a Single-Acting Pump, but in a Double-Acting Pump ought to be the same size.

Water can not be raised *successfully* by suction more than 20 to 25 feet, although the theoretical distance is 33.94 feet. The Suction Pipe may extend horizontally almost any distance, if air-tight; we recommend the use of a Check or Foot-valve, with a long vertical or horizontal Suction Pipe.

Turns and Elbows are to be avoided in the Suction or Discharge Pipe, as they cause considerable friction, and add to the power required to operate the Pump.

For pumping hot water or liquids, the Pump should be fitted with metal valves, and should be placed as near the supply as possible, in order to force it upward instead of raising it by suction. Hot water or liquids can not be raised any distance by suction, as the vapor or steam rises into the Pump, instead of the liquid.

To operate a Double-Acting Pump, twice the power is required that it takes to work a Single-Acting Pump, but double the amount of water will be discharged. We give the following rule for calculating the capacity of a piston pump :

RULE.

Multiply the area of the bore of the Cylinder by the length of the stroke, and the result by the number of strokes per minute, which gives the quantity of water in cubic inches. Divide the number of cubic inches by 231, the number of cubic inches in a gallon, and the result will be the capacity of the Pump per minute in gallons. Multiply this result by 2 for a Double-Acting Pump.

To determine the power required, multiply the number of gallons per minute by 8.35, the weight of one gallon of water, and the result by the number of feet the water is raised, which will give the power in foot-pounds. Divide the number of foot-pounds by 33,000, which will give the "horse-power" required to do the work. This will give the theoretical power; in practice, a discount should be made for friction and other causes.

With the aid of the following Table, the capacity of a Pump and the power required to operate the same can be readily calculated.

TABLE CONTAINING THE DIAMETERS AND AREAS OF CIRCLES FROM 2 TO 12 INCHES.

DIAMETER.	AREA.	DIAMETER.	AREA.	DIAMETER.	AREA.
2 inches.	3.1416	5 $\frac{1}{2}$ inches.	23.758	9 inches.	63.617

4 $\frac{1}{2}$ "	15.904	8 "	50.265	11 $\frac{1}{2}$ "	103.869
4 $\frac{3}{4}$ "	17.720	8 $\frac{1}{4}$ "	53.456	11 $\frac{3}{4}$ "	108.434
5 "	19.635	8 $\frac{1}{2}$ "	56.745	12 "	113.976
5 $\frac{1}{4}$ "	21.647	8 $\frac{3}{4}$ "	60.132	12 $\frac{1}{4}$ "	117.859

A cubic foot of water weighs 62 $\frac{1}{2}$ pounds, and contains 7 $\frac{1}{2}$ gallons. Doubling the diameter of a pipe increases its capacity four times. A steam boiler of any size requires one cubic foot of water per hour for each nominal horse-power. Power Pumps should be run so that the Piston travels about 100 feet per minute.

REVOLVING-TOP CISTERN PUMP.

With Bolted Base and Polished Cylinder.

Fig. 118.

Fig. 118 represents our Standard Cistern Pump. It is made with a broad low Base, with Coupling below, as shown in cut, and like all our Pumps of this class, is made with Sand Valve Seat.

NEW STYLE CLOSE-TOP PITCHER-SPOUT PUMP.

With Adjustable Lever and Cut-off Base.

Fig. 125.

Fig. 125 exhibits our Improved Close-Top, Pitcher-Spout Pump, a style favorably known everywhere. In its construction we have taken especial care that it should want nothing essential to an absolutely perfect Pump. It is arranged with a Revolving Top, located outside of the Water-way, which permits of the Lever being moved to any desired position. The Cylinders are bored perfectly true, and finely polished. The attachment for connecting the Suction Pipe is both simple and complete; a substantial Iron Hub projects from the bottom of the Base, on which is screwed a Coupling Nut, threaded for gas pipe, through which a soldering tube is introduced, for connecting to lead pipe when desired. All parts are finished to exact gauges. Repairs will always fit.

SIZES AND PRICES.

Fitted for either Iron or Lead Pipe, or both, as ordered.

MOLASSES, OR HOT LIQUID PUMP.

Metallic Fitted.

Fig. 140.

This cut shows our Molasses, or Hot Liquid Pump. It is adapted for pumping molasses, hot water, or any hot liquids or syrups. It has a revolving top, and the lever can thus be placed in any desired position. In the iron Pumps the valves, connecting-tube, piston and piston-rod are made of brass. The brass Pumps are made entirely of that metal, except the base, top and lever, so that no iron will come in contact with the liquid. When used for hot liquid, the Pump should be placed as near to it as possible, as the vapor arising tends to destroy the vacuum produced by the Pump.

We make five sizes, fitted for lead or iron pipe connections.

REVOLVING TOP CISTERN PUMP.

With Wrought Iron Set-Length.

The Pump shown here is our Fig. 121, with Wrought Iron Set-Length, for *out-door* use in cisterns and shallow wells, where an ordinary Cistern Pump would be liable to be affected by frost. They are rendered anti-freezing by a small drip-hole in the pipe above the Cylinder. When so ordered, we furnish the Standard and Cylinder only, so that the Pump may be fitted by the purchaser for any depth well.

These Pumps are fitted with either screwed or bolted cylinders, as ordered, at same list prices.

SIZES AND PRICES.

No. 1,	2 $\frac{1}{4}$	inch bore,	fitted for	1 inch	Pipe.....	\$6 00

" 6,	3 $\frac{1}{2}$	"	"	" 2	" 9 00

We can furnish these Pumps fitted for any size pipe, American or foreign, as ordered. Standard and Cylinder, without Set-Length, 50 cents less list for each size.

Fig. 117.

REVOLVING-TOP PITCHER-SPOUT PUMP.

With Wrought Iron Set-Length.

Fig. 130 represents our Pitcher-Spout Pump with Wrought Iron Set-Length. They are adapted to use in shallow wells and cisterns, and are rendered anti-freezing by a small drip hole in the pipe above the Cylinder. These Pumps are fitted with either Bolted or Screwed Cylinders at same list prices. The lower Valve-Seat is brass. Furnished for either lead or iron pipe, as ordered. When so ordered, we furnish the Standard and Cylinder, without Set-Length, so that the Pump may be fitted by the purchaser for any depth well.

Fig. 130.

IMPROVED ANTI-FREEZING WELL PUMP.

With Wrought Iron Set-Length.

This cut represents our Fig. 200. It is adapted to shallow wells, cisterns, or driven wells, and by lowering the Cylinder to within say 20 feet of the water, will be found to work to good advantage in wells from 40 to 50 feet deep.

The Lever is adjustable. The Standard and Base are securely connected with iron bolts. The Cylinder, as in all our Pumps, is bored perfectly true and highly polished, and connected to the Standard by three feet of wrought iron pipe, which is provided with a *vent hole*, located just above the Cylinder, permitting all the water above the freezing point to escape from the Pump. We make the lower Valve either of leather, or of leather faced with rubber, and with either *Iron* or *Brass* Valve Seat, but always of *Iron*, unless otherwise ordered.

Our Valve Seats are all of an improved design, and cannot be clogged with sand. Length of stroke, six inches. All threads cut to exact gauges. Repairs will always fit.

SIZES AND PRICES,

" 4,	3 " " " 1 $\frac{1}{4}$ " " "	8 50
" 5,	3 $\frac{1}{4}$ " " " 1 $\frac{1}{4}$ " " "	9 00

We furnish the above with Bolted Cylinders at same price, when so ordered.

Fig. 200.

IMPROVED ANTI-FREEZING WELL PUMP.

With Cast Iron Set-Length.

Fig. 201.

Fig. 201 exhibits our Improved Anti-Freezing Well Pump with Cast Iron Set-Length. The Pipe, or set-length, connecting the Cylinder with the Pump Standard, is one-fourth inch larger inside diameter than the Cylinder, and is so arranged that the Plunger, when new packing is required, can be easily drawn up through the Set-length and Standard by simply loosening the set-screw in the top under the Lever. When not in use, the water in Standard and Connecting Pipe will escape through the vent shown in cut, immediately above the Cylinder, thereby making the Pump positively anti-freezing.

It is made with Sand Valves, and is especially adapted to out-door cisterns, and open or driven wells not over thirty feet deep.

SIZES AND PRICES.

No. 2,	2¼-inch bore,	for 1 inch suction pipe.....	\$7 00
" 3,	2½ " " " 1¼ " " "	7 50
" 4,	2¾ " " " 1½ " " "	8 00
" 5,	3 " " " 1¾ " " "	8 50

Length of stroke, 6 inches. All threads cut to exact gauge. Repairs will always fit.

TIGHT-TOP ANTI-FREEZING WELL PUMP.

With Wrought Iron Set-Length.

Fig. 202.

Fig. 202 represents our Tight-Top Anti-Freezing Well Pump. It is similar to our Fig. 200, the difference consisting of a closed top (through which a polished Rod passes), and the necessary links connecting the Rod to the Handle, to prevent the rocking motion of the Rod as in Open-Top Pumps. Each size of this Pump is several inches taller than the corresponding size of the Open-Top. It is preferred for some locations, as no stones or dirt can be thrown into it, and the direct vertical motion of the Piston renders it less liable to require frequent repacking. It thus possesses many points of excellence, which, with its low price, make it a very popular Pump. We furnish it with Bolted Cylinder when so ordered, at same list price.

SIZES AND PRICES.

No. 2, 2½ in. bore	for 1¼ in. Suction Pipe	\$8 25

" 5, 3 " " 1¼ " " "	9 75

All our threads are cut to exact gauges, and repairs will always fit.

SPECIAL ANTI-FREEZING DRIVE-WELL PUMP.

With Wrought Iron Set-Length Connected under Spout.

Fig. 208.

Fig. 208 represents a Pump combining many advantages which commend it to the public generally, and especially to those interested in the Driven-Well business. It already occupies a position in the estimation of the trade second to no other Pump of like character.

The Standard and Base are cast solid; and strength, compactness and symmetrical proportions combine in its mechanical design to make it perfect.

The Set-Length Pipe, connecting the Standard with the Cylinder, is attached immediately under the Spout, so that but a very few strokes of the lever are required to deliver the water, and leaving an air space between Pipe and inside of Pump Standard, which in itself is an absolute protection against frost, while an additional protection is afforded by the vent hole in Pipe just above the Cylinder. It is made with Screwed or Bolted Cylinder, as ordered. It has a Sand Valve Seat.

SIZES AND PRICES.

No. 2,	2 $\frac{1}{2}$ in. bore,	for 1 $\frac{1}{4}$ in. Suction Pipe.....	\$8 25
" 3,	2 $\frac{3}{4}$ " " "	1 $\frac{1}{4}$ " " "	8 50
" 4,	3 " " "	1 $\frac{1}{4}$ " " "	9 00

" 6,	3 $\frac{1}{2}$ " " "	1 $\frac{1}{2}$ " " "	10 00

FIG. 209.

Same Pump with Close Top, add 75 cents to above list for each size.

Standard and Cylinder only, 50 cents less list.

Duplicate parts of this Pump may always be obtained from us.

SPECIAL ANTI-FREEZING TUBE-WELL FORCE PUMP.

With Wrought Iron Set-Length.

Fig. 220.

Fig. 220 represents our Anti-Freezing Tube-Well Force Pump. We have taken more than ordinary pains in the construction of this Pump, and can confidently recommend it as a most excellent Force Pump both for open and driven wells.

The Standard is the same for each size Cylinder. The Lever is long, heavy and perfectly balanced, and is adjustable to any point most convenient for use. The Piston-Rod is polished, and works through a *brass Stuffing Box*. The Cylinder is located three feet below the Base, and the Connecting Pipe is provided with the usual drip hole for allowing the water in the Standard and Pipe to escape in cold weather, thus rendering the Pump anti-freezing.

This Pump is strongly made, is handsome in design, and is provided with a suitable Brace. A Spout Hose-Coupling accompanies each Pump, and when requested, we can furnish Rubber Hose in any quantity at manufacturers' prices.

The Cylinder is accurately bored and very highly polished. The Valves are proof against sand, and the Valve-Seats are made of either Iron or Brass; but always of Iron (which we consider preferable), unless otherwise ordered. These Pumps are cast from metal patterns, and all threads cut to exact gauges, which insure perfect duplicates, should repairs become necessary.

SIZES AND PRICES.

No. 3,	2 $\frac{3}{4}$ inch bore,	for 1 $\frac{1}{4}$ inch Suction Pipe.....	\$13 00
" 4,	3 " " " 1 $\frac{1}{4}$ " " "	13 00
" 5,	3 $\frac{1}{4}$ " " " 1 $\frac{1}{4}$ " " "	13 50
" 6,	3 $\frac{1}{2}$ " " " 1 $\frac{1}{2}$ " " "	14 50

Standard and Cylinder only, same list price. Three feet Hose and Discharge Pipe, \$3.00 extra list.

IMPROVED ANTI-FREEZING WELL FORCE PUMP.

With Wrought Iron Set-Length.

This illustration represents a Force Pump long and favorably known to the trade. It is largely used in yards, gardens, stables, etc., and makes a very efficient fire protection, when located adjacent to private residences. On account of its strength, durability, efficiency and cheapness, it has long been a favorite Force Pump; and with our superior manner of constructing it, we bespeak for it increased popularity. It is supplied with a suitable Brace, and a Spout-Coupling for attaching hose. By lowering the Cylinder to within about 15 or 20 feet of the water, it may be used in wells from 60 to 80 feet deep, although we would recommend the use of our *Improved Deep Well Cylinders* in connection with this Standard, for wells over 50 feet in depth.

When used as an ordinary Lift-Pump, the Nut on top of the Air-Chamber should be loosened.

SIZES AND PRICES.

fit.

Fig. 221.

SPECIAL WELL PUMP STANDARD.

Screwed for Iron Pipe.

Fig. 227.

Fig. 227 shows our Special Well Pump Standard, which is handsome in design and substantially constructed, and when used with our Special Cylinders (Figs. 302 and 303), or with our Improved Deep Well Cylinders (Figs. 304 and 305), will give perfect satisfaction. This style of Pump has been known as a "shallow-well Pump," but it will be found equally suited to wells of more than ordinary depth.

It is supported by a strong Brace, and has an extra long and heavy Lever.

The Suction Pipe is screwed into the Standard just below the Spout, which makes the Pump less liable to be affected by frost.

Fitted for either 1, 1 $\frac{1}{4}$, 1 $\frac{1}{2}$ or 2 inch wrought iron Pipe, but always for 1 $\frac{1}{4}$ inch Pipe, unless otherwise ordered.

Price, Standard, complete, as shown in cut..... \$6 00

Length of stroke, 8 inches.

CLOSE-TOP DEEP-WELL PUMP STANDARD.

Fig. 230.

This cut exhibits a style of Pump Standard which has been well and favorably known by dealers for many years; and in deep-well localities it is considered the Standard Pump. Its beauty, compactness and general points of excellence will commend it to those desiring Pumps of this class. It can be used in wells 150 feet deep. For open wells, it should be used with our Improved Deep-Well Cylinders (Fig. 304), and for drilled wells with our Improved Drilled-Well Cylinders (Fig. 305). Length of stroke, 7 inches.

SIZES AND PRICES.

All parts are interchangeable. Repairs will always fit.

DEEP-WELL FORCE PUMP STANDARD.

Fig. 231.

This Pump is constructed in the same manner as Fig. 230, with the addition of the Air Chamber and Stuffing - Box necessary to make it a Force Pump. It will be found efficient in any place where a Force Pump is required. It is a style so generally and favorably known that we need only add that we guarantee it to be the most perfect Pump of its class manufactured. It is used in connection with our Improved Deep-Well Cylinders (Figs. 304 and 305). Length of stroke, 7 inches.

SIZES AND PRICES.

EXTRA HEAVY DEEP-WELL PUMP STANDARD.

Fig. 232.

This cut represents our most substantial Deep-Well Pump. It is essentially of the same class as Fig. 230; differing only in that it is made much heavier and stronger, and is arranged with a revolving Fulcrum, so that it can be used either *Right* or *Left Handed*. For use in public places, where constant use and rough handling need be expected, we especially recommend this Pump, with the positive assurance that it will give satisfaction.

WIND-MILL PUMP STANDARD.

With Brackets.

Fig. 399.

Fig. 399 represents a Wind-Mill Standard arranged with Brackets. This arrangement often fills a want that could not be covered by any other device. The top of the Standard is made in the same manner as those of our regular Wind-Mill Standards, as shown on several of the following pages. The bottom of the Standard is fitted with gas pipe thread, to which the Connecting Pipe between it and the Cylinder is easily attached.

Fig. 399, complete, as shown in cut. 6 inch stroke..... \$5 50

We have now in course of construction, and will show in our next edition, a *Wind-Mill Force Pump Standard*, with *Brackets*, designated as Fig. 398. In general style it will correspond with our Fig. 404, shown on page 209, and will take its place where a Base Pump of that character will not suit the location. This Pump will be ready for the trade in a very short time.

Fig. 398, complete..... \$10 00

WIND-MILL LIFT PUMP STANDARD.

Fig. 400.

This cut accurately illustrates our Fig. 400. Of this Standard we make two sizes, Nos. 4 and 5. The No. 5 is made with either 6 or 10 inch stroke, as ordered. The Connecting Pipe is attached just below the Spout, which greatly lessens the liability to injury from frost.

SIZES AND PRICES.

		6 IN. STROKE.	10 IN. STROKE.
No. 4 Standard, complete with Brace.....		\$7 00	—
" 5 " " " "		8 00	\$9 50

Fitted for 1, $1\frac{1}{4}$, $1\frac{1}{2}$ or 2 inch Pipe, but always for $1\frac{1}{4}$ inch Pipe, unless otherwise ordered.

WIND-MILL LIFT PUMP STANDARD.

For Tubular and Deep Wells.

Fig. 401.

Fig. 401 accurately represents an improvement in Wind-Mill Pumps, which will at once be recognized and appreciated by any one interested in the Tubular or Artesian Well business. The Pump is in two sections, between which is introduced a Flange fitted for either $1\frac{1}{4}$, $1\frac{1}{2}$, 2 or $2\frac{1}{2}$ inch Pipe, as required, held firmly in position by the bolts connecting the two sections of the Standard.

This Pump is equally well adapted to any character of Deep Wells. It being made in two parts makes it possible to place it in position at the well with about one-half the amount of labor required by the old style of heavy Deep-Well Pumps.

SIZES AND PRICES.

WIND-MILL LIFT PUMP STANDARD.

With Adjustable Stroke

Fig. 402.

In presenting the Pump represented by the annexed cut, we do so with the assurance that we are offering to the public an article, the need of which has long been felt by all manufacturers and dealers in Wind-Mill Pumps. By our device the Pump, in a moment's time, can be arranged for either 6, 8 or 10 inch stroke, by simply changing the position of the two pins in the fulcrum. In other respects this Pump is identical in construction with that of Fig. 400. Wind-Mill Attachments and Rod Couplings accompany each Pump.

SIZES AND PRICES.

Fig. 402, complete, as shown in cut..... \$10 00

Fitted for either 1, 1 $\frac{1}{4}$, 1 $\frac{1}{2}$ or 2 inch Pipe, as desired, but always for 2 inch Pipe and Forked Rod, unless otherwise ordered.

WIND-MILL FORCE PUMP STANDARD.

Fig. 404.

This cut shows our new Wind-Mill Force Pump Standard. This is a handsome, well proportioned Pump, and is made extra strong, being especially designed for heavy work. It has a discharge in the Stock opposite the Spout. This will be found a great convenience where the water is to be discharged into a tank. The Connecting Pipe is attached in the body of the Pump below the Spout.

Fitted for 1, 1 $\frac{1}{4}$, 1 $\frac{1}{2}$ or 2 inch Pipe, but always for 1 $\frac{1}{4}$ inch Pipe, unless otherwise ordered.

SPECIAL WIND-MILL FORCE PUMP STANDARD.

With Cock and Flanged Base.

Fig 412.

Fig. 412 represents another of our special Wind-Mill Force Pump Standards. Like Fig. 407, a Flange is introduced at the base which admits of connecting with pipe up to 3 inches in diameter. In all other respects the Pump is identical with that shown as Fig. 411. This style of Force Pump is often preferred on account of its compactness, the Air Chamber being formed by the swell in upper part of Standard. It is especially adapted to *Tubular* or *Artesian Wells*.

WIND-MILL FORCE PUMP STANDARD.

Fig. 405.

Fig. 405 represents a Force Pump Standard, embracing the usual appliances necessary for a Wind-Mill Pump. In construction, it is not unlike Fig. 400. It has a Revolving Top, and is supported by a substantial Brace. The Connecting Pipe from the Cylinder is attached in the body of the Pump, below the Spout, making it less liable to be affected by frost. The threads are cut for either 1, 1 $\frac{1}{4}$, 1 $\frac{1}{2}$ or 2 inch Pipe, but always for 1 $\frac{1}{4}$ inch Pipe, unless otherwise ordered.

	6 IN. STROKE.	10 IN. STROKE.
Fig. 405, complete, as shown in cut.....	\$13 00	\$14 50
With Cock on Spout, \$2.50 extra list.		

SPECIAL WIND-MILL FORCE PUMP STANDARD.

Fig. 406.

This cut exhibits our Special Wind - Mill Force Pump Standard, which is peculiarly adapted to heavy work, as in deep wells, or where an unusual quantity of water is to be raised. The Pump is made in two sections, between which is introduced an independent Flange, screwed for wrought iron Pipe. The advantages of this arrangement are apparent. The Connecting Flanges can be Screwed for any size of Pipe up to $2\frac{1}{2}$ inches.

6 IN. STROKE. 10 IN. STROKE.

Standard, complete, as shown in cut	\$13 50	\$15 00
Extra Flanges, cut for 1 or $1\frac{1}{4}$ inch Pipe, each.....		50
" " " " $1\frac{1}{2}$, 2 or $2\frac{1}{2}$ inch Pipe, each.....		60

With Cock on Spout, add \$2.50 to list.

SPECIAL WIND-MILL FORCE PUMP STANDARD.

With Cock and Flanged Base.

Fig. 407.

Fig. 407 represents a Pump similar in design to Fig. 406, differing only in that it has the addition of a Cock on Spout and Back Outlet. The *Flange* Pipe Attachment is located at the base of the Pump, which admits of attaching to Pipe up to 3 inches in diameter. This Pump is especially adapted to large size *Tubular* or *Artesian Wells*.

Extra Flanges, cut for 1 or 1¼ inch Pipe.....		50
“ “ “ “ 1½, 2 or 2½ inch Pipe.....		60

ANTI-FREEZING WIND-MILL FORCE PUMP.

With Three-Way Cock.

Fig. 409.

This illustration correctly represents our Fig. 409, a style of Pump which, with Wind-Mill manufacturers, has met with much favor, and very justly, as it combines many features not covered in any Pump previously introduced, viz.: A Standard absolutely independent of any of the working parts of the Pump. The double Water-Way, in connection with the Three-Way Cock, governed by a rod projecting through the Base of the Pump, directing the water either through the Discharge, above the platform, or through a line of pipe running underground to any point desired. By this means, the water may be forced from a well or reservoir, no matter where located, into a residence, barn, or into a tank, from which a stock tank, a lawn hydrant, or a fountain, can be readily supplied. The Three-Way Cock and Stuffing Box are located four feet below the Base, which prevents it from freezing in cold weather. The Pipe connecting with the Base of the main Standard forms an Air Chamber of sufficient area to produce an even and steady discharge of water. The Cylinder can be located at any point desired, below the working head.

6 IN. STROKE. 10 IN. STROKE.

Price, complete, as shown

in cut.....	\$18 00	\$19 50
-------------	---------	---------

Any part of this Pump can be duplicated on short notice, our connections being all tool-cut, and tested to perfect gauges.

ANTI-FREEZING WIND-MILL FORCE PUMP.

With Improved Vertical Distributing Valve.

Fig. 410.

The principal advantages of Fig. 410 over other Pumps of this class are as follows :

The brass Three-Way Cock and Taper Plug are superseded by a plain Vertical Valve, made of soft, pure rubber, which is very elastic and durable, so carefully made that it can not wear out, even with careless usage, for many years, and will not stick or corrode. This style of Valve is of our own invention, and much superior to any other in use. It can readily be removed and replaced by any inexperienced person in a few minutes.

The Vertical Valve is actuated by a star (or wheel) and a brass screw, which are connected to the Valve by a strong, well guided rod, the whole arrangement being impervious to frost, very simple, easily operated, and not at all liable to get out of order.

The Valve openings are very large, admitting of a free discharge of water in either direction.

A decided improvement over any other similar Pump made is the Union Coupling and Elbow on the underground discharge. By this means, the handle may be turned in any direction most convenient for use, and the Elbow turned to suit the direction of the pipe in the ditch. It also saves the purchaser the expense of a malleable union for each Pump. The Discharge Pipe is enlarged to $1\frac{1}{4}$ inch, and the Air Chamber Pipe to 2 inches. This gives an Air Chamber capacity four times as great as when a 1 inch pipe Air Chamber is used, insures a steady flow of water from the spout, and relieves the Wind-Mill or operator of about one-fourth the labor required to operate the old style Pump.

We have also adapted Fig. 410 to use on 2 inch and $2\frac{1}{2}$ inch Tubular Wells, and by our arrangement, the Plunger may be entirely withdrawn from the well pipe, without removing either the Standard or flat rod. These improvements are to be found only in Pumps made by us.

When so ordered, we make this Pump with Adjustable Stroke, so arranged that the purchaser can easily adjust it to either 6, 8 or 10 inch stroke.

SIZES AND PRICES.

Fig. 410, with 6 in. Stroke, arranged to draw out Plunger	\$18 00
" 410, " 10 " " " " "	19 50
" 410, " Adjustable Stroke, " " " "	20 50

Fitted for 1, $1\frac{1}{4}$, $1\frac{1}{2}$, 2 or $2\frac{1}{2}$ inch Suction Pipe, but always for $1\frac{1}{4}$ inch, unless otherwise specified.

Fitted for $\frac{3}{4}$, 1, $1\frac{1}{4}$ or $1\frac{1}{2}$ inch Discharge Pipe but always for 1 inch, unless otherwise specified.

HAND FORCE PUMP ON BASE.

With Wind-Mill Top.

Fig. 430.

The above style of Pump can be used in connection with Wind-Mills, or in any place where power can be applied. It is also arranged to be worked by hand. In cold climates, to prevent freezing, raise the Lever to its extreme height, which will trip the Valves, and allow the water to escape from the Cylinder.

DOUBLE-ACTING SUCTION AND FORCE PUMP, ON PLANK.

With Brass Piston Rod. Right or Left Handed.

Fig. 541.

Fig. 541 represents our Double-Acting Suction and Force Pump, without Air Chamber. It is mounted on Plank, and can be used either right or left handed.

This Pump being double-acting, will furnish double the quantity of water that would be supplied by a single-acting Pump of the same caliber, but requires an additional outlay of power. Where a steady and continuous stream of water is required, it will be found an excellent Pump.

Where the distance the water has to be forced is very great, better results will be obtained by using this Pump with Air Chamber, as shown on following page.

Length of stroke, 7 inches.

SIZES AND PRICES,

	IRON	BRASS.	WITH METALLIC VALVES FOR HOT WATER.

Deduct \$2.00 from above prices when ordered without Air Chamber.

For Iron Cock with Brass Plug, add \$2.50 to above prices.

For all Brass Cock, add \$5.00 to above prices.

With two Pulleys instead of Balance Wheel, add \$5.00.

Fig. 526.

DOUBLE-ACTING SUCTION AND FORCE PUMP, ON PLANK.

With Tight and Loose Pulleys for Power.

Fig. 543 represents our Double-Acting Suction and Force Pump, on Plank, with tight and loose Pulleys for Power.

In ordering these Pumps state the quantity of water to be raised, size of Driving Pulley, and speed of Main Shaft, and we will fit them with Pulleys of the proper size.

The Brass Pumps are always furnished with Iron Air Chambers, unless otherwise ordered. When Brass Air Chambers are ordered we charge additional cost of material only.

Length of stroke, seven inches.

These Pumps are furnished with two Handles and Fly Wheel (same as Fig. 526) instead of Pulleys, when so ordered, at above prices.

Fig. 543.

"TRIUMPH" HORIZONTAL DOUBLE-ACTING FORCE PUMP.

With Brass Lined Cylinder and Adjustable Lever.

Fig. 600.

Fig. 600 represents our "Triumph" Double-Acting Force Pump, on Iron Frame. The Cylinder is Brass lined, the Piston Rod, Valves and Valve Seats are Bronze, and all other wearing parts exposed to the action of the liquids are rendered non-corrosive. Brass Plugs are provided at each end of the Bed Plate for letting the water out of the Cylinder to prevent freezing, and a similar Plug may be withdrawn to prime the Pump when necessary. The upper Valves may be reached by unscrewing the Brass Nuts and lifting off the Air Chamber. The lower Valves may be reached by then lifting off the Body of the Pump. We fit these Pumps for both iron Pipe and Hose unless otherwise ordered, but furnish connections for either lead Pipe or Hose, when requested, without extra charge. All sizes have Metallic Valves.

A Malleable Wrench, fitting all Nuts and Couplings, furnished with each Pump.

“TRIUMPH” HORIZONTAL DOUBLE-ACTING FORCE PUMP.

With Brass Lined Cylinder and Adjustable Lever.

Fig. 601.

The general description of Fig. 600 on the preceding page applies also to Fig. 601, shown above. It is mounted on Plank, for use on shipboard, wharves and around mills, warehouses, etc.

It has lately been used quite extensively for testing boilers, and is a very efficient Pump for that purpose. We fit them always for both iron Pipe and Hose unless ordered specially for lead Pipe.

SIZES AND PRICES.

"TRIUMPH" HORIZONTAL DOUBLE-ACTING FORCE PUMP.

With Brass Lined Cylinder and Two Levers.

Fig. 602.

This cut represents our "Triumph" Double-Acting Force Pump, with two Levers. This Pump will be found very useful in factories, warehouses, on vessels, and other places where large quantities of water are to be moved. The Cylinder is brass lined; the Valves Valve Seats, Piston Rod, and other parts coming in contact with the water, are made of bronze. The Levers can be disconnected, so that it can be worked by one lever when desired. We fit them always for iron Pipe and Hose, unless ordered specially for lead Pipe.

“TRIUMPH” HORIZONTAL DOUBLE-ACTING FORCE PUMP.

With Brass Lined Cylinder, Arranged for Power.

Fig. 603.

Fig. 603 represents our “Triumph” Double-Acting Force Pump, arranged for Power, mounted on Plank, with Pitman, Guide, and Guide Rod for attaching to Crank Pin or Face Plate.

This Pump is made with Brass Lined Cylinder. The Valves, Valve Seats, Piston Rod and other parts coming in contact with the water are made of Bronze.

This Pump will be found wonderfully efficient, and reliable where any Pump of like capacity can be used. For Rail Road Water Stations, about Breweries, Distilleries, etc., it is already much used and highly valued. Its ordinary speed should be about 50 strokes per minute, but can be increased to 80 if required. To compare capacity, refer to tables on page 186.

“TRIUMPH” HORIZONTAL DOUBLE-ACTING FORCE PUMP.

On Frame for Power.

Fig. 604.

Fig. 604 represents our well-known “Triumph” Double-Acting Suction and Force Pump, arranged with tight and loose pulleys, 4 inches wide and 18 inches diameter. The Cylinder is lined with hard rolled brass, and the Valves, Valve-Seats and Rod are of bronze. The motion is transmitted by means of the well known and popular slotted Cross-Head, driven by a cast-steel crank pin, working in a bearing block of bronze or gun metal, the whole mechanism being securely bolted to a handsome and substantial bed plate, 25 by 32 inches. It is the most compact and useful Pump of its class, and we unhesitatingly recommend it as a complete and perfect Power Pump for water, oil, fermented or acetous liquors, for fire protection, or any other use where a steady, powerful and reliable stream is desired. This Pump may be run at from 75 to 90 revolutions per minute, when necessary, though 50 revolutions is about the right speed. We always fit this Pump for both iron Pipe and Hose, and can fit for lead Pipe when so ordered. We guarantee this Pump to work against a pressure of 100 pounds to the square inch.

IMPROVED. HAND AND POWER PISTON PUMP.

With Air Chamber, Crank Shaft, Pulley and Handle.

Fig. 585.

This Pump is suitable for raising water from shallow wells or cisterns, by hand or power, and forcing it to any point desired. It is most frequently used for filling boilers, tanks, etc.

It has a steel Crank Shaft, and is made throughout of the best material and in the most workmanlike manner. We consider it the best Pump of the kind yet introduced.

SIZES AND PRICES.

Fitted to connect to our Deep Well Cylinders, Figs. 304 and 305, when used in wells over 20 feet deep.

TWO CYLINDER FORCE PUMP.

With Wood Levers.

Fig. 615.

The above cut represents our Two Cylinder Force Pump. This Pump has been long and favorably known as one of the most efficient Fire Pumps ever offered the public, and it will be found especially effective about factories, railroad stations or any place where fire protection is required. This Pump has always ranked above all others as a Deck Pump, on our lake and river vessels.

SIZES AND PRICES.

SIZES AND PRICES.								IRON.	BRASS.

LARGE HAND ROTARY FORCE PUMP.

Fig. 575.

This cut shows *large* sizes of our Hand Rotary Force Pump. It is a positive Suction and Force Pump, metallic fitted, making it especially adapted for the requirements of Brewers, Distillers, Wine Producers, Gas Companies, etc. As an Oil Pump it has no equal; and for water, hot or cold, it can be used in place of ordinary Piston Pumps. For pumping acids, the working parts should be made of *Bronze* metal. For pumping hot liquor, we arrange them with Metallic Check Valves, without additional expense. We also list Fig. 574, which is similar to Fig. 575, but smaller.

HAND ROTARY FORCE PUMP.

With Barrel Attachment and Goose-Neck Spout.

Fig. 576.

Fig. 576 represents our Hand Rotary Force Pump, arranged as a Barrel Pump, which combines all the desirable features of Pumps of this class.

To dealers in Oils and Liquors, this Pump is almost indispensable. With Connecting Pipe or Hose, the fluids can be transferred from the cellar into a tank situated in any part of the building. It is a positive direct acting Suction and Force Pump, not liable to get out of order, has large capacity, and requires but little power to operate it. A Barrel Attachment, a Goose-Neck Spout, and a Suction Pipe three feet long, accompany each Pump.

SIZES AND PRICES.

ROTARY FORCE PUMP, ON FRAME.

With Tight and Loose Pulleys for Power.

Fig. 577.

Fig. 577 represents a Power Rotary Pump, the internal construction of which is identical with our Fig. 575. It can be operated by hand, by attaching a handle to the end of the shaft. Balance wheels, with handles, furnished, when ordered, at additional cost named in list.

This Pump is extensively used in distilleries, breweries, wine cellars, meat packing establishments, oil refineries, etc., and is especially efficient, as a fire pump, being capable of throwing water from 125 to 150 feet horizontally.

SIZES AND PRICES.						IRON.	BRONZE.

" 2, 14 "	" 4, 27 "	" 6, 55 "

POWER ROTARY FORCE PUMP.

With Tight and Loose Pulleys.

Fig. 580.

Fig. 580 exhibits our justly celebrated Power Rotary Force Pump, on Frame, with tight and loose Pulleys. It is complete in all sizes, requiring no extra couplings or bearings, and only requires to be securely bolted in position and attached to the driving power. It is exceedingly strong, durable and compact in construction, has cast steel Shaft, and bearings strong enough to resist any pressure, and is double-gearred. A large Vacuum-Chamber is cast in the frame into which the Suction Pipe is screwed. These valuable improvements render this Pump more easily placed in position, smoother in operation, and durable and efficient than any Rotary Pump in the market.

We make them of Bronze when so ordered. The bearings should be kept well oiled. After using, turn the Cams backward two or three times to empty the pump of water, then pour in a little good oil and turn the Cams forward a few times, to prevent rusting while not in use. Any of our Power Rotary Pumps may be used for fire service.

IMPROVED BOILER FEED PUMP.

With Stub End for Power.

Fig. 588.

The above cut represents the ordinary style Stub End Boiler Feed Pump, with the improvement of attaching the Check Valves with Flanges and Bolts, instead of being cast to the body of the Pump, as is the case with most of the cheap and unserviceable Pumps made by other manufacturers.

The Check Valves are provided with Coupling Nuts and Brass Tubes for connecting Pipes with Pump.

SIZES AND PRICES.

STEAM BOILER FEED PUMP, ON BED PLATE.

With Column and Two Pulleys.

FOR HAND OR POWER.

Fig. 591.

This cut shows our Steam Boiler Feed Pump on Bed Plate, with tight and loose pulleys and crank.

This Pump is built in the most thorough and workmanlike manner, and all corresponding parts are made exact duplicates. It is provided with a handle, so that it can be used to fill the boiler by hand before the steam is up. The pulleys are faced off and vary in diameter according to the size of the Pump. The Check Valves are bolted to the Pump, and may be removed and replaced when worn, or new ones supplied, thus making them preferable to Pumps of other manufacturers, which are made with the Check Valve cast on. When so ordered we furnish these Pumps with all Brass Check Valves at a small additional cost. Each pulley is provided with a set screw for fastening it to the Crank Shaft.

STEAM BOILER FEED PUMP, ON BED PLATE.

With Column and Two Pulleys. For Hand or Power.

Fig. 592.

This cut represents an improved Boiler Feed Pump on Column, with tight and loose pulleys for power. There is a strong wrought iron handle on the end of the Crank Shaft opposite the Face Plate, so that the boiler can be filled by hand when necessary. The Crank Shaft has a bearing on each side of the pulleys. Instead of being cast on, the Check Valves are *bolted* to the Pump, and may be readily removed when they become worn. The Plungers and Valves are Brass, and the Valve Cases are Iron, but when so ordered we furnish these Pumps with all Brass Check Valves at a small additional cost. Each pulley is provided with a set screw for fastening it to the Crank Shaft.

DESCRIPTION OF IMPROVED HYDRAULIC RAM.

On the following page will be found a cut of our Improved Hydraulic Ram. The simplicity and effective operation of this Machine, and its great durability, make it the most valuable and useful apparatus yet developed in the department of Hydraulics for elevating water and conveying it to any point desired.

The purposes for which this Machine can be used to advantage are many, viz: for supplying dwellings, stables, factories, railroad stations, stock yards, etc., with running water, and for irrigating lands. When once set and in operation it requires no further attention, and will last for years without trouble or expense.

The efficiency of the Ram, however, depends on the amount of fall to be obtained. It may be used when the spring or brook is only 18 inches higher than the Ram; yet as the height increases, the more powerfully the Ram operates and its ability to force water to a greater elevation and distance is correspondingly increased. The relative height of the source of supply above the Ram, and the elevation to which it is required to raise the water, determine the relative proportion between the water raised and wasted; the quantity raised varying according to the height it is conveyed, with a given fall as explained below.

Rams are frequently successfully employed for driving water a distance of from 1500 to 3000 feet, and to a height of from 100 to 200 feet above the Ram; and they have even been known to perform still greater service. When the water has to be forced long distances, the conveying pipe should be somewhat larger than for short distances, to compensate for the friction and inertia of the water in the pipe.

A fall of 10 feet from the Reservoir to the Ram is sufficient to raise water to any point less than 150 feet above the level of the machine. The same amount of fall would also raise water to a point much higher, though the amount of water supplied would be correspondingly diminished as the height and distance increase.

For ordinary purposes it may be safely calculated that about one-seventh of the water can be raised and discharged at an elevation five times as high as the fall, or one-fourteenth part may be raised and discharged about ten times as high as the fall; and so on in like proportion as the fall or height is increased or diminished.

Turns or angles in either drive or discharge pipe, should be avoided if possible. When they become necessary in setting the Ram, make the elbows as large as possible and substitute curves for angles wherever practicable.

We make these Rams of Iron and Bronze. The Valve Stem and Case are always made of the latter material, which is more durable than any other metal.

The Ram should be placed in a pit, and the Drive and Discharge Pipes should be run underground in order to protect them from injury by frost and other causes.

Table of sizes, prices, capacity, etc., will be found on the following page.

IMPROVED HYDRAULIC RAM.

Fig. 690.

SIZES AND PRICES.

Size.	Quantity of Water furnished by the fountain to which the Ram is adapted.	Length of Drive Pipe.	Caliber of Pipe.		Price.
			Drive.	Discharge.	
No. 2	$\frac{1}{2}$ to 2 gallons per minute.	25 to 50 feet.	$\frac{3}{4}$ inch.	$\frac{1}{2}$ inch.	\$ 9 00
" 3	$1\frac{1}{2}$ " 4 " "	25 " 50 "	1 " "	$\frac{1}{2}$ " "	11 00
" 4	3 " 7 " "	25 " 50 "	$1\frac{1}{2}$ " "	$\frac{1}{2}$ " "	14 00
" 5	6 " 14 " "	25 " 50 "	2 " "	1 " "	22 00
" 6	12 " 25 " "	25 " 50 "	$2\frac{1}{2}$ " "	$1\frac{1}{4}$ " "	40 00
" 7	20 " 60 " "	25 " 50 "	4 " "	2 " "	75 00
" 8	20 " 125 " "	25 " 50 "	6 " "	$2\frac{1}{2}$ " "	125 00

To obtain the greatest force from the supply, the Drive Pipe should descend from the Fountain to the Ram on an angle of 45 degrees. When the Fountain is more than 12 feet above the Ram, and the Drive Pipe descends on an angle of more than 45 degrees, there should be one or more coils made in the Drive Pipe, in order to reduce the velocity of the water, and prevent injury to the Ram.

IMPROVED HAM PUMP.

Fig. 694.

The above is a cut of our Improved Ham Pump, which will be found the most perfect Pump of the kind in the market. It is neat, compact, strong and powerful in operation. The working parts are made of Brass, and the Injecting Needle or point is nickel plated.

With this Pump the pickle is forced into every part of the ham at once. Hams can be cured in this way in from three to four weeks, summer or winter.

No butcher can afford to be without one of these Pumps, as they will save many times their cost during a season.

PRICE.

Ham Pump, complete.....	\$15 00
-------------------------	---------

PORTABLE GREENHOUSE PUMP.

Fig. 660.

This cut represents a Portable Hand Force Pump, which is held in great favor and very generally used about the private residences, warehouses and public buildings of this and almost every other country. It is especially adapted for use in greenhouses, about stables for washing carriages, and is of more than ordinary value in cases of incipient fires. It is light and easily handled, weighing only eight pounds, and the low price places it within the reach of all who may require such a pump.

Fig. 660, with 2½ feet Suction and 3 feet Leading Hose, Brass Discharge Pipe and Sprinkler.....	\$9 00
Extra for Conical Tip to use in forcing out pipe.....	1 00

“SYPHON” PUMP.

Fig. 320.

The above cut represents our Improved Syphon Pump, for use with Wind-Mills or other suitable power. The Suction Pipe enters the Outer Cylinder several inches above the Lower Valve. By this means the Valves are always immersed, and the pump is always primed. It has *Brass* Plunger, and the working Cylinder is either *all Brass* or *Brass lined*, as ordered. Length of stroke, 7 inches.

In the past few years, this Pump has grown into constant favor on its merits, and we do not hesitate to recommend it for any place where it can be used, guaranteeing perfect satisfaction.

The following prices are for *Brass lined* Cylinders.

SIZES AND PRICES.

No. 1, 2½ inch Cylinder, 1½ inch Suction, 1¼ inch Discharge.....	\$25 00
“ 2, 3 “ “ 1½ “ “ 1½ “ “	25 25
“ 3, 3½ “ “ 2 “ “ 2 “ “	27 25
“ 4, 4 “ “ 2 “ “ 2 “ “	30 50

Add \$3.00 extra to list for forked Rod to attach to Wind-Mill. Larger sizes made to order. *All Brass* Cylinders \$3.00 extra list.

CYLINDER PLUNGERS.

The above cuts show the Plungers we use in our various styles of Cylinders.

"A" is all iron, with leather packing, and is used in Figs. 300 and 301.

"B" has a brass Cage and Valve, is leather packed, in addition to an iron Follower $1\frac{1}{2}$ inches long in 12 inch Cylinders, and 3 inches long in 14 inch Cylinders. This Plunger is used in Figs. 302, 303, and in the 14 inch, Fig. 312.

"C" has a brass Cage and Valve, with an Iron Follower 5 inches long. The Follower is cut with water grooves, and is turned to fit the Cylinder perfectly. It will work equally well with or without leather packing. Used in Figs. 304, 305 and 316.

"E" is all iron; has a 2 inch Follower. The Valve plays loose on the Piston Rod, closing on a Spider Seat. This Plunger is leather packed, and is used in Fig. 313.

"F" is all brass, with Stem Valve; the Follower is turned to fit the Cylinder perfectly, and is packed with cupped leather packing. Used in Fig. 312.

"G" is all iron, same as "A" Plunger, excepting that it has a Flat Rod for attaching to wood Piston Rod. It is used in Fig. 318.

It is generally understood that the Cylinder of a Pump is the most important part of it; and that a perfect Cylinder is absolutely essential to a perfect Pump. In offering our extensive line of Cylinders to the trade, we take some little pleasure in stating that they are each and every one perfect in every respect, and made in the most scientific and workmanlike manner.

Each Cylinder is accurately bored and highly polished. They are all cast from metal patterns, and all threads tool-cut to exact gauges, which insures to any who may want repairs, perfect duplicates.

We can furnish any Cylinder with *Brass* Valve Seat when so ordered.

Fig. 371.

Fig. 372.

The above cuts represent Air Chambers with different forms of discharge, which are used on our various styles of Hand and House Force Pumps, shown on preceding pages. We send them with Flange holes ready drilled; they may be placed on any of the Pumps to which they are suited, without extra fitting. Always fitted with four holes in Flange, unless otherwise ordered.

Fig. 370.....	\$2 00	Fig. 371.....	\$2 00	Fig. 372.....	\$2 50
---------------	--------	---------------	--------	---------------	--------

Fig. 360.

This cut shows a Cock used in connection with several of our Hand Force, Well Force and Wind-Mill Force Pumps. It has iron Case and brass Plug, and is fitted with right and left hand Coupling Nut.

No. 1, For Pumps with Cylinders $3\frac{1}{4}$ inch or less in diameter, fitted for 1 inch Hose Coupling.....	\$2 00
No. 2, For Pumps having Cylinders larger than $3\frac{1}{4}$ inch, fitted for $1\frac{1}{4}$ inch Hose Coupling.....	2 50

GOOSE NECKS.

Fig. 361.

Fig. 362.

The above Goose-Necks are suited to any of our Hand and House Force Pumps, and are fitted for attaching hose, when desired.

PRICE LIST OF REPAIRS.

On this and the following pages will be found Price Lists of Parts or Repairs for all the leading Pumps manufactured for us. In offering these lists, we wish to impress very emphatically upon the minds of our patrons that all Repairs ordered of us will supply the places for which they are intended *without extra fitting*, as our threads are cut to exact gauges, all holes drilled to perfect templets, and, whenever possible, all castings made from metal patterns.

RADIAL CENTER BRASS JACKET DRIVE WELL POINTS.

Fig. 1.

This cut shows the Malleable Radial Center.

Fig. 2.

This cut shows the Radial Center wound with heavy galvanized wire, ready for putting on the Wire Gauze and Brass Jacket. A 2-foot Point of this kind will supply more water than any 3-foot Point made of pipe.

Fig. 3.

This cut shows the finished Point.

1¼ INCH POINTS.

PRICE LIST

	LENGTH.	SIZE JACKET.	PER DOZ.
No. 60 Wire Gauze	20 inches.	14 inch.	\$30 00

" 80 "	2½ "	24 "	52 00

When it is necessary to drive in *very fine quicksand*, we would recommend using the Radial Center Points, covered with either No. 90 or 100 Wire Gauze, which very seldom fails to keep out the finest sand.

For price of No. 90 Gauze Points, add 10 per cent to price of No. 80 Points, and for No. 100 Gauze, add 20 per cent to price of No. 80.

18 ".....	30 "	15	89,932	2,855	753 00

The above prices include nothing but the staves, bottom, dowel-pins and iron hoops, on board cars at Kansas City. All sizes up to and including the 14x10 are made of 2-inch plank and have drive hoops. The 12x12 and larger are made of 3-inch, and the hoops are provided with lugs and bolts for tightening. If drive hoops are preferred for these sizes, a discount of 5 per cent will be allowed. We set up every tank, and mark each piece and every hoop. All our tanks are built of soft pine, free from sap, shakes and unsound knots, and guaranteed not to leak if properly set up. We will quote prices on tanks made of CLEAR pine when desired.

PATENT IMPROVED CLAY AND SAND AUGERS.

When it is necessary to drive through clay or hard-pan, it is best to use an Auger like the one here shown, and bore through before driving. B and C are provided with a thread on the upper end, so they can be lengthened out with a piece of pipe to bore almost any depth. They are made of the best material, and will bore the fastest and easiest of any Augers in the world. Four-inch is the size generally used. They are indispensable to wellmen. A bores in soft, loose sand, gravel, clay and small stones; B is hard steel, and bores in blue clay, soft sandstone and soapstone.

McNAMARA'S PATENT COMPRESSION VALVE DRY PIPE HYDRANT AND STREET WASHER.

With Improved Ornamental Post.

This Hydrant and Street Washer has the advantage over all others from the fact that all the working parts are in a Dry Pipe, which is thoroughly protected both at the top and bottom, so that water cannot enter it, thus avoiding the possibility of frost affecting it in any manner in the coldest weather.

The workings of this Hydrant and Street Washer are so plainly shown by the accompanying cuts that further explanation is unnecessary. The following are the principal advantages claimed in the use of these Hydrants and Street Washers:

- 1st. They are not liable to get out of order, but in case of needed repairs it can be done without digging up or removing the Pipe or Stock from the ground.
- 2d. They are made of Iron and Brass, and so cannot rot out.
- 3d. They are perfectly anti-freezing, the waste being automatic and operating with certainty, so that no water can remain in the pipes when the water is shut off.
- 4th. They are positive in operation, simple in construction, and for durability and service they will stand extreme water pressures.

" 7, " " 4 ft. 1 in. up to 6 ft. 2 in., " "	2 50	"

The covers to these boxes are all strongly made. If extra heavy ones are required, the additional expense will be 5 cents each.
All our boxes are coated with coal tar inside and outside to protect from rust, etc.
Keys for opening covers supplied free of charge.

No. 14 Extension Section, or En-
larged Base.

These are intended for extra large service cocks
Price, 40 cents.

This extra section is used in connection with any of our regular sizes of service boxes. The shaft above the bell is about the same diameter outside as the inside lower part of the service box, and is made slightly tapering so that it will telescope, or set inside the base of the service box about four inches, thus closing up the smaller side openings of regular service box, and gives a base having openings 1 1/8 inches larger than regular size.

No. 15, Extension Section (not illustrated) for increasing length of boxes two feet, 55 cents.

No. 0.

Stationary length, 10 in.
diam. inside, in
smallest part, 3 1/2 in.

No. 14.

Enlarged base to telescope in-
side service boxes at the base.
